

ENERGY SAVINGS IDEA: CEILING FANS

The onset of warmer weather in late spring and summer heralds the start of the "air conditioner season." One energy saving solution used by many homeowners combines the cooling effects of a ceiling fan with the use of a room air conditioner or whole-house air conditioner.

The evaporative cooling created by the moving air from the fan keeps the room's occupants comfortable while allowing the air conditioner thermostat setting to be raised to a more economical operating level.

Visit our "Who Makes What" section for more information about ceiling fans.
